Artificial Intelligence

Artificial Intelligence is a machine that can plan, learn, problem solve to an extent, so it is able to solve a problem like a human. Nowadays, its mostly used to target advertisement, spot spam emails and messages and virtual assistants.

In my daily life, I use Apple's Siri a lot. She helps me with setting timers when I cook, reads me my messages when I am working on something and do not have time. Siri reminds me about things, so I do not forget them such as important dates and friends' birthdays. Alas, somethings I dislike about Siri is that sometimes she does not compute what I say, and she is unable to do all the tasks I need her to do. I am hoping that in the future Siri will be as capable as Amazon's Alexa who can complete the same tasks as Siri and more.

Another AI I that helps most people daily is Spam filters on emails. They help filter the important emails and spam advertisement emails which will save me, the user, a lot of time. It works by searching for certain words commonly used on spam emails, and the AI must be able to quickly learn and update to prevent most spam emails. But sometimes the AI makes a mistake and counts an important email as spam, which is annoying when you are expecting an email and do not receive the notification because the AI thought it was a spam email and removed it.

To conclude, the introduction of AI has helped mankind develop and adapt and focus more of our time and minds to fix more important problems, while also making life easier.
